***Post Biopsy / ED&C Wound Care Instructions***

Leave the present dressing in place for 12-24 hours. If you have mild oozing or bleeding, hold pressure with gauze or tissue for 15-20 minutes without letting go.

It's OK to get the wound wet 24 hours after the procedure.

**Daily wound care:** Gently clean the wound with soap and water. Dry gently. Apply a layer of bacitracin ointment twice daily and cover with a band-aid. Since the adhesive on a band-aid can irritate the skin, change the direction of the band-aid each day. This should be continued for a week or until the scab falls off. After the scab falls off, apply Vaseline twice daily until the wound is completely healed.

**Results:** I will call you within 2 weeks of your biopsy with the results if you require further treatment.

If you have any questions or concerns, please call my office.
